

Hello review team,

It is amazing that solar power is worth so little. Last I recalled it is a renewable source of electricity which is sold to the customer at a premium. Solar power is also generated at peak time which makes it even more valuable.

I remember when the Dept. of Primary Industry and Environment first reduced the FIT down from 25 cents. The new 8 cent FIT was going to be ramped up by 2 cents per year. What happened???

Anyway, how do you justify 5 cent per kwh for solar power?? Please let me know.

It costs the network next to nothing to transport it.

I question the independence and fairness of the ESC.

I think the ESC and other very connected parties are pushing consumers off the grid.

Regards

Gary Baker
